Dear Diane,

I am glad to learn that you are going to publish my article "What Policy For Nerve Gas?" Here is a biographical sketch as you requested.

Matthew Meselson, the Thomas Dewey Cabot Professor of the Natural Sciences, at Harvard University was from 1973 to 1972 consultant on biological and chemical warfare to the United States Arms Control and Disarmament Agency. He has written articles on the arms control of chemical and biological weapons, particularly from the point of view of US National security interests. He recently has edited the volume, "Chemical Weapons and Chemical Arms Control," published in 1978 by the Carnegie Endowment for International Peace.

With best regards,
